                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma) Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonaphritis sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejecti graft rejection; ischaemia; reperfusion; glomerulonephritis; seps allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR enthers the system of the present RNA sequence represents a human PKR enthers of the system of the present RNA sequence represents a human PKR enthers of the system of the present RNA is accurate.

                                                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                  RESULT 1916
                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises nucleic acids (e.g. antisense oligonucleotides) of that down regulate the expression or inhibit the function of a receptor (FrGDR), or a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (FrGDR), or probably kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central convention are glioma), inflammatory disease (e.g. rheumatoid arthritis, inflammatory disease, lugus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lugus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The concleic acids of the invention are also useful for down-regulating the capression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a charget RNA in a cell. The present RNA sequence represents a human PKR cuberters segmentered.
                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PRGDR), is a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PRGDR), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, crestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rej graft rejection; ischaemia; reperfusion; glomerulonephritis; allergy; asthma; allergic rhinitis; atopic dermatitis; human

The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephiltis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR). IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CMS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            05-APR-2001; 2001US-00827395.

                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IKappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the cinvention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, Lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, crestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic cubertars accurate accurate as a cell. The present RNA sequence represents a human PKR cubertars accurate accurate.
                                                                                                                                                                                                                                                                                                                          Query Match

IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                restenosis; asthma; Crohn' autoimmune disease; lupus; graft rejection; ischaemia allergy; asthma; allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Unidentified

```
The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor cC for a neurite growth inhibitor, NoGO, prostaglandin D2 receptor (PTGDR), CC lkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lugus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cucleic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a CC curve of the complex of the invention are also useful for down-regulating the CC content of the complex of the presence of a carget RNA in a cell. The present RNA sequence represents a human PKR curvers a security of the content of the curvers of the content of the cont

                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NCGO, prostaglandin D2 receptor (PTGR),
C IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascullar accident, central
rervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
c lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
c restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
c ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
c conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
c expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                              Query Match

The nucleic acids of the convention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, Iymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, crestenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        05-APR-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Icor a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lugus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-APR-2001; 2001US-00827395.

```
The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC (RappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC (1ymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC current scand mutations within diseased cells or to detect the presence of a
CC current scandard.
CC current scandard.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), I RappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, 1 ymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cubstrate segmence.

                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohm's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RAA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                         Matches

   that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), (IkappaB kinase (IKK), or protein kinase PKR The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, (Iymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, crestenosis or asthma), Crohm's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                Query Match

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC restenosis or asthma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rej graft rejection; ischaemia; reperfusion; glomerulonephritis; allergy; asthma; allergic rhinitis; atopic dermatitis; human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               05-APR-2001; 2001US-00827395.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, 'Lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, 'Crestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The mucleic acids of the invention are also useful for down-regulating the 'Crestenosion of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cuberters secretors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     that down regulate the expression or inhibit the function of a receptor (CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC likappaB kinase (IRK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune (disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC nucleic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                       Matches

The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or acopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-APR-2001; 2001US-00827395.

The invention comprises nucleic acids (e.g. antisense oligonucleotides) cc that down regulate the expression or inhibit the function of a receptor cc for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), cc [RappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the ci invention are useful for treating: cerébrovascular accident, central cc nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, cc gribona), inflammatory disease (e.g. rheumatoid arthritis, cc restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune cc disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The cc conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The cc cucleic acids of the invention are also useful for down-regulating the cc expression of a target gene and as a diagnostic tool to examine genetic cultifis and mutations within diseased cells or to detect the presence of a carget RNA in a cell. The present RNA sequence represents a human PKR contacts.
                                                                                                                                                                                                                                                                                                                                                                                                           Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-APR-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR

that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NGG), prostaglandin D2 receptor (PTGDR), it is appeared to the motion are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, 1ymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR),
KappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
rervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
the injury apinal cord injury apinal cord injury,
the injury apinal cord injury,
the injury apinal cord injury apinal cord

                                                                                                                                                                                                                       RESULT 1937
                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC leapas kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cucleic acids of the invention are also useful for down-regulating the CC currents account of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a carget NAA in a cell. The present NAA sequence represents a human PKR currents accounts.
                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, Lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, cestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cubetrars sequence.
                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                             멍
                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
I kappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis,
classe, lupus, multiple sclerosis, transplant/graft rejection,
ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises nucleic acids (e.g. antisense oligonucleotides) of that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), (C IkappaB kinase (IKX), or protein kinase PKR. The nucleic acids of the cinvention are useful for treating: cerebrovascular accident, central corrous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, (C Iymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, cor estenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune (c ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The c cupiession of a target gene and as a diagnostic tool to examine genetic cord crifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cubertars according.

                                                                                                                                                                                                   The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor comprises for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the comprose system (CNS) injury, spinal cordinates acident, central comprose or glioma), inflammatory disease (e.g. rheumatoid arthritis, cc restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune comprosed acident injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The concleic acids of the invention are also useful for down-regulating the compression of a target gene and as a diagnostic tool to examine genetic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The concleic acids of the invention are also useful for down-regulating the captesion of a target gene and as a diagnostic tool to examine genetic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The concleic acids of the invention are also useful for down-regulating the captes and mutations within diseased cells or to detect the presence of a carget RNA in a cell. The present RNA sequence represents a human PKR

                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises nucleic acids (e.g. antisense oligonucleotides)
Ct that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NCGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the cinvention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, cestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cushelfare segmence.
                                                                                                                                                                                                                                                                                                                                      Query Match

The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the convention are useful for treating: cerebrovascular accident, central convention are useful for treating: cerebrovascular accident, central conventions and glioma), inflammatory disease (e.g. rheumatoid arthritis, cc restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune conventions, conventions, conventions, conditions (e.g. asthma), crohn's disease, diabetes, obesity, autoimmune conventions, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The curleic acids of the invention are also useful for down-regulating the convention of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a carget RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   05-APR-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel method of determining a predisposition for or the occurrence of neurodegenerative disease comprising detecting in a target nucleic acid obtained from the subject the presence of an allelic variant of polymorphic regions of human genes selected from urokinase plasminogen activator (uph), gamma-synuclein (SNCG), insulin degrading enzyme (IDE), kinesin-like protein 1 (KNSL1), lysosomal acid lipase (LIPA) and tumour necrosis factor receptor SF6 (TNFRSF6). The method is useful in determining the presence or predisposition to a neurodegenerative disease, particularly Alzheimer's disease. The present sequence is that of a sequencing primer which was used for sequencing of a region of the human IDE gene in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Becker KD,

Also described: (I) CC treating (M2) glioma involves contacting cells of the glioma with an CC identifying (M3) a test compound as potential anticancer or antiglioma (I), monitoring an expression product of the at least one gene and CC (I), monitoring an expression product of the at least one gene and CC identifying test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M4) a test compound CC as potential anticancer or antiglioma drug involves contacting a test compound contacting at least one gene and CC identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; and (M4) a test compound with the cell which expresses mRNA of at least one gene and identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) an immune response to glioma involves administering to a mammal, a protein CC information of glioma cells, and as immune response inducers. (M1) is useful for aiding in diagnosing glioma. (M2) is useful for treating multi carries of the glioma at a mammal having glioma or in a mammal who has had a glioma surgicially removed. The present sequence represents a human GEM long tag oligonucleotide, which is used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a composition which contains at least one vector (B) containing a nucleic acid (I) associated with breast cancer. The vector (B), also polypeptides (II) encoded by (I), are used for treatment of breast cancer. Arrays based on (I), (II), or their fragments, and (II) specific antibodies (Ab) are used to predict characteristics (e.g. invasiveness or stage) of breast cancer, and (I), or its fragments, are used to modulate characteristics of such cells; to identify breast cancer genes and to detect breast cancer (by detecting polymorphic nucleic acid or its products). The present sequence represents a human ER+ breast cancer differentially expressed sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo

                                                                                                                    The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           breast cancer; cytostatic; gene therapy; GP6; GPIV; GPVI; chromosome 19q13.4; ss; single nucleotide polymorphism.
                                                                                                                                                                                                                                                                                        Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                       25-NOV-2002;

                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cycostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human chromogranin B (CHG2;secretogranin coloridation).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    breast cancer; cytostatic; gene therapy; human; chromogranin B; secretogranin 1; SCG1; chromosome 20pter-p12; ss; PCR; primer; 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying a subject at risk of breast cancer by detecting the or absence of one or more nucleotide polymorphic variations, use diagnosing, preventing and/or treating breast cancer.

The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human chromogranin B (CHGB;secretogranin 1;SCG1) DNA which is located at chromosomal position 20pter-p12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.

                                                                                                                                                                                                                                                                 as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV,GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                           of breast cancer which comprises detecting the presence or absence of or or more polymorphic variations associated with breast cancer in a nucle acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer,
                                                                                                                                                                                                          Sequence 17 BP; 5 A; 3 C; 6 G; 3 T; 0 U; 0 Other;

Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the DLG1, KIAAO783, DPF3 or CENPC1 regions which are associated with breast cancer in a nucleic acid sample from a

Example 6, Page 91; 227pp; English.

The present invention relates to a method for identifying a subject at risk of breast cancer. The method comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The nucleic acid sample comprises the DLGI region (ADO79402), KIAA0783 region (ADO79403), DPF3 region (ADO79404) or CENPC1 region (ADO79405). The gene DLGI (discs,

DLG1 has been mapped to chromosomal position 3ç29. The CC gene KIAA0783 is also known as PHF14 and PHD finger protein 14. KIAA0783 CC has been mapped to chromosomal position 7p21.3. The KIAA0783 protein is a CC novel gene with unknown function, however, being a zinc finger protein, CC it likely to be a transcription factor. The gene DPF3 D4, zinc and CC double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 CC and 2810403B03Rik. DPF3 is a Rho family guanine-nucleotide exchange CC factor. DPF3 has been mapped to chromosomal position 14q24.3-q31.1. The CENPC1 (centromere protein C1) is also known as Centromere CC q13.3. CENPC1 is a centromere autoantigen and a component of the inner CC kinetochore plate. The CENPC1 protein is required for maintaining proper CC kinetochore size and a timely transition to anaphase. The method is CC useful for identifying a subject at risk of breast cancer, for early CC useful to a response to a breast cancer treatment, and in clinical drug trials. The present sequence was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 1953

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC comprises the DLG1 region (ADO79402), KIAAO783 region (ADO79403), DPF3
CC region (ADO79404) or CENPC1 region (ADO79405). The gene DLG1 (discs, CC large homolog 1 (Drosophila)) is also known as synapse-associated protein CC 97, hdlg or SAP97. DLG1 has been mapped to chromosomal position 3029. The CC gene KIAAO783 is also known as PHF14 and PHD finger protein 14. KIAAO783 (C novel gene with unknown function, however, being a zinc finger protein, is a CC novel gene with unknown function, however, being a zinc finger protein, CC double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 (C double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 (C gene CENPC1 (centromere protein C1) is also known as CERD4, cer-d4, FLJ14079 (C gene CENPC1 fis a centromere autoantigen and a component of the inner CC suscentiate of the centromere autoantigen and a component of the inner CC kinetochore plate. The CENPC1 protein is required for maintaining proper Kinetochore size and a timely transition to anabhase. The method is C useful for identifying a subject at risk of breast cancer, for early CC diagnosis, prevention and treatment of breast cancer, to analyze and CC predict a response to a breast cancer treatment, and in clinical drug trials. The present sequence was used in an example from the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC cancer in a nucleic acid sample from a subject. The nucleic acid sample comprises the DLG1 region (AD079402), KIAA0783 region (AD079403), DPF3 CC region (AD079404) or CENPC1 region (AD079405). The gene DLG1 (discs, CC large homolog 1 (Drosophila)) is also known as synapse-associated protein CC gene KIAA0783 is also known as BPF14 and PHD finger protein 14. KIAA0783 (CC has been mapped to chromosomal position 7921.3. The KIAA0783 protein is a convel gene with unknown function, however, being a zinc finger protein, CC it likely to be a transcription factor. The gene DPF3 (D4, zinc and CC double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 (CC factor. DPF3 has been mapped to chromosomal position 14024.3-q31.1. The CENPC1 (centromere protein C1) is also known as Centromere CC q13.3. CENPC1 has been mapped to chromosomal position 14024.3-q31.1. The CC q13.3. CENPC1 is a Centromere protein C1 is also known as Centromere CC kinetochore plate. The CENPC1 protein is required for maintaining proper CC kinetochore size and a timely transition to anaphase. The method is useful for identifying a subject at risk of breast cancer, for early CC diagnosis, prevention and treatment of breast cancer, to analyze and CC predict a response to a breast cancer treatment, and in clinical drug crials. The present sequence was used in an example from the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human rumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ22452-25501 and AAQ30226-447. (Updated on 25-MAR-2003 to correct PN field.) (Updated
                                     This is an exemplary oligonucleotide primer, for use in the detection of neoplasmic related gene mutations. There are over 40 known protonocogenes and suppressor genes to date, which control growth, development, and cell differentiation. Regulation of these genes can, under certain circumstances, be altered and normal cells can assume neoplastic growth characteristics. The invention provides a method for detecting a neoplastic disorder of the head and neck or lung in a subject. The detection of a target mutant nucleotide sequence in the saliva is indicative of a neoplastic disorder of the head, neck or lung. This allows early detection and therefore treatment of the preneoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neoplasia; mutant; target nucleotide; neck cancer; head cancer; saliva test, primer; PCR; amplification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                        The present invention describes a method for identifying compounds which modulate the activity of epidermal growth factor-containing fibrillin like extracellular matrix protein 1 (BFEMP1). The human BFEMP1 coding and protein sequences are also provided. Compounds of the invention can be used in the treatment of macular degeneration and other diseases related to BFEMP1. The present sequence is a PCR primer for a fragment of the

The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic inflammation, cancer, nervous system diseases in difference in the state of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPB. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; tesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.

cc performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or determity of a SNP and for genotyping nucleic acid samples, for e.g. to cassess by association analysis the genotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cc agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cdystrophy, familial hypercholesterolaemia, polycystic kidney disease, cc osteogenesis imperfecte and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial cdisease, including, rheumatoid arthritis, multiple sclerosis, including, rheumatoid arthritis, multiple sclerosis, concorganism. The method is also useful in forensic investigations and contermity analysis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences AAH37205 AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by
                                                                                                                                                                                                                                                                                                                        Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; Page 56; 83pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens.

The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPB primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid samples by CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC aused by one or more SNPB. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC disease include symptoms of or susceptibility to multifactorial CC traits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimmune CC inflammation. Cencer. nervous swstem diseases and infection by nathogenic CC inflammation. Cencer. nervous swstem diseases and infection by nathogenic

The invention relates to an isolated nucleic acid (I) involved in growth cregulation in human colonic epithelial cells, termed CATX. (I) is useful cas a probe/primer for detecting tumours, preferably colon cancer. The nucleic acid, encoded polypeptide and antibody are useful in diagnosis cand treatment of abnormal cell growth (such as cervical cancer, and treatment of abnormal cell growth (such as cervical cancer, lymphomas), in screening assays for the treatment of abnormal cell growth, for raising antibodies, and to screen for peptide analogues and cantagonists. (I) is useful as a biomarker for human tumour cells, e.g., colon cancer cells, for generating probes and primers designed for colonic cancer cells, for generating probes and primers designed for stage of development, so that premalignant cells can be identified prior to their spreading throughout the human body. (I) allows early detection of potentially cancerous conditions, and treatment of the cancerous conditions prior to development of an irreversible cancerous condition. ABK27426-CC ABK27469 represent human colon cancer associated coding sequences and crimers of the invention

(DNAS-) DNA SCI LAB INC

Hall J;

2002-698522/75

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

12; Page 122; 714pp; English

Combletule comprising at least one base variation from that off a known cytochrome P450 Al (CYP4501Al), aryl hydrocarbon receptor nuclear translocator (CANT), cathepsin S (CTSS), cytochromesa 2 (CXP2), 5-lipoxygenase activating cytochromeyl cytochromesa 2 (CXP12), histamine.N-methyl cytochromeyl transferase 2B4 (CYP4501A), UDP-glucuronosyl transferase 2B4

Predicting a therapeutic response comprises comparing a first nucleic acid allele in an interleukin-10 (IL-10) regulatory region with a secondicia acid allele in the IL-10 regulatory region associated with a outcome a second

Claim 12; SEQ ID NO 4; 34pp; English

The invention relates to a method for predicting an individual's Ctherapeutic response to the administration of interferon-alpha-2b and cribavirin for the treatment of a pathological condition, especially chapatitis C virus (HCV) infection. The method involves determining which allelic form is present at positions -3575, -2763, -1082, -819 and -592 cof the interleukin-10 (IL-10) regulatory region, and comparing these with cthe allelic forms at these positions which are associated with a known outcome of interferon-alpha-2b and ribavirin administration. Presence of the single nucleotide polymorphisms -592A and -819T, the -592A/A or -CC the single nucleotide polymorphisms -592A/ and -819T as a haplotype, or possession of the (108)TCATA haplotype (encompassing positions -3575, -2763, -1082, -CC the (108)TCATA haplotype (encompassing positions -3575, -2763, -1082, -CC the (108)TCACC haplotype indicates that the patient will be non-ccc responsive to this therapy. The method optionally further comprises

The invention also encompasses kits and oligonucleotide primers for use in the methods of the invention. The method and primers are useful for identifying and analysing genetic polymorphisms in the IL-10 regulatory region and/or cytotoxic T-lymphocyte antigen-4 which can be used in predicting an individual's response to therapeutic intervention with interferon-alpha-2b and ribavirin for HCV infection, and for predicting the responsiveness of an individual to therapy for a pathological condition, or for predicting the outcome of therapeutic intervention in pathological conditions such as bacterial infection (e.g. meningococcal infection), rheumatoid arthritis, systemic lupus erythematosus, Sjogren's syndrome, inflammatory bowel disease or multiple sclerosis. The present sequence is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; haemal,
gene therapy;
                The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CDG which distinguishes between methylated and non-methylated CDG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Haematopoietic cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-JAN-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABZ10660 standard; DNA; 18
                                                                                                                                                                          Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cytosine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC represent specifically claimed nucleotide sequences from the present cc invention. Oligonucleotides from the present invention can be used: for CC disorder haematopoietic dells; for differentiating between healthy haematopoietic cells and proliferative CC disorder haematopoietic dells; for differentiating between acute CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for CC determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder CC related sequences and their complements; and a primers for the CC amplification of haematopoietic cell proliferation disorder related DNA CC sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between CC be used for detecting a predisposition to, differentiation between CC classe, diagnosis, prognosis, treatment and/or monitoring of CC haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                   abnormality is an indication that the patient has an increased risk of the late-onset neurodegenerative disease. DAO is a flavin dinucleotide (FAD) -dependent oxidase which catalyses the oxidative deamination of D-amino acids (EC.1.4.3.3). The method of the invention has neuroprotective and antiparkinsonian applications and may be useful in determining an increased risk of a late-onset neurodegenerative disease to a patient, as well as in preparing a medicament for treating a late-onset neurodegenerative disease to a patient, as well as in preparing a medicament for treating a late-onset neurodegenerative disease (AD), possibly via gene therapy. The current sequence is that of a PCR primer 2 of the invention which was used to amplify human D-amino acid oxidase exon 1 gDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                late-onset neurodegenerative disease; D-amino acid oxidase; DAO; flavin dinucleotide; FAD-dependent oxidase; D-amino acid oxidative deamination; EC.1.4.3.3; neuroprotective; antiparkinsonian; amyotrophic lateral sclerosis; ALS; Parkinson' Alzheimer's; gene therapy; human; ss; PCR; primer; chromosome 12

Also described is a method (M1) for the treatment of acute coronary syndrome (ACS) in an individual comprising administering (1) (1) has antiatherosclerotic, cardiant and antianginal activities, and can be used as a leukotriene biosynthesis inhibitor, and a leukotriene receptor antagonist. (I) can be use for the manufacture of a medicament for the treatment of myocardial infarction or susceptibility to myocardial infarction in an individual who has at least one risk factor chosen from an at-risk haplotype for myocardial infarction, an at-risk haplotype in the 5-lipoxygenase activating protein (FLAP) gene, a polymorphism in a FLAP nucleic acid and an at-risk polymorphism in the 5-lipoxygenase (5-thosen from the form of the form o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens.

                                                                                         The present sequence is that of primer D12SDK1F which, with primer CC D12SDK1R AD043262, can be used to amplify D12SDK1, a novel microsatellite CC marker associated with bipolar affective disorder and genetically related CC unipolar affective disorder. D12SDK1 comprises a dinucleotide repeat. 8 CC Alleles (134-152 bp) have been detected. A locus for bipolar disorder and CC related unipolar affective disorders has been fine mapped on chromosome C1 2 (C12) for the first time and several genes that are carrying mutations CC region is approximately 2 million base pairs of DNA in the chromosomal CC region 12q24.3 on the short arm of chromosome 12 between markers D1282705 CC and D12S340. The inventors genotyped 21 newly described and previously published microsatellite markers in a sample of 381 Danish and British CC bipolar patients and compared the frequency of marker alleles to a CC matched control group. Differences in allele frequencies, which were CC highly statistically significant, were found for 10 of these markers. Based on the results, the invention provides markers and methods of using them in diagnosing, or determining the susceptibility of an individual compounds for use as part of therapeutic and/or diagnostic methods. A method of treatment comprises administering a substance that modulates capacitative gene or which modulates the level of activity
                                                                   method of treatment comprises expression of a candidate gene of a candidate gene product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Diagnosing, prognosing, or determining the susceptibility to, a neuropsychiatric disorder using a C12 candidate gene region marker by determining the structure, level of expression or activity of a polypeptide encoded by the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bipolar affective disorder; Unipolar affective disorder; diagnosis; marker; neuroleptic; gene therapy; PCR; primer; human; ss.

                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises a method for identifying a subject at risk of melanoma. The invention involves detecting the presence or absence of one or more polymorphic variations associated with melanoma in the neuropilin 1 (NRP1) or mannose receptor C type 2 (MRP2) genes. The method of the invention is useful for identifying subjects at risk and treating melanoma. The present DNA sequence represents an extension PCR primer that was used to detect single nucleotide polymorphisms within human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo

The invention involves detecting the presence or absence of one or more polymorphic variations associated with melanoma in the neuropilin 1 (NRP1) or mannose receptor C type 2 (MRC2) genes. The method of the invention is useful for identifying subjects at risk and treating melanoma. The present DNA sequence represents an extension PCR primer that was used to detect single nucleotide polymorphisms within human
